   ee. a. How many moles of Na₂S₂O₃ are needed to react with 0.12mol of Cl₂?
   ff. b. How many moles of HCl can form from 0.12mol of Cl₂?

20) In dilute nitric acid, HNO₃, copper metal dissolves according to the following equation:
   3Cu(s) + 8HNO₃(aq) → 3Cu(NO₃)₂(aq) + 2NO(g) + 4H₂O(aq)
   How many grams of HNO₃ are needed to dissolve 11.45g of Cu?

21) The reaction of powdered aluminum and iron(II)oxide,
   2Al(s) + Fe₂O₃(s) → Al₂O₃(s) + 2Fe(l)
   produces so much heat the iron that forms is molten. Because of this, railroads use the reaction to provide molten steel to weld steel rails together when laying track. Suppose that in one batch of reactants 4.20mol Al was mixed with 1.75mol Fe₂O₃.
   mm. a. Which reactant, if either, was the limiting reactant?
   nn. b. Calculate the mass of iron (in grams) that can be formed from this mixture of reactants.

22) Silver nitrate, AgNO₃, reacts with iron(III) chloride, FeCl₃, to give silver chloride, AgCl, and iron(III) nitrate, Fe(NO₃)₃. A solution containing 18.0g AgNO₃ was mixed with a solution containing 32.4g FeCl₃. How many grams of which reactant remains after the reaction is over?
Theoretical and percent yield

23) Barium sulfate, $\text{BaSO}_4$, is made by the following reaction:

$$\text{Ba(NO}_3\text{)}_2(\text{aq}) + \text{Na}_2\text{SO}_4(\text{aq}) \rightarrow \text{BaSO}_4(\text{s}) + 2\text{NaNO}_3(\text{aq})$$

An experiment was begun with 75.00g of $\text{Ba(NO}_3\text{)}_2$ and an excess of $\text{Na}_2\text{SO}_4$. After collecting and drying the product, 63.45g $\text{BaSO}_4$ was obtained. Calculate the theoretical yield and percent yield of $\text{BaSO}_4$.

24) Aluminum sulfate can be made by the following reaction:

$$2\text{AlCl}_3(\text{aq}) + 3\text{H}_2\text{SO}_4(\text{aq}) \rightarrow \text{Al}_2(\text{SO}_4)_3(\text{aq}) + 6\text{HCl(}\text{aq})$$

It is quite soluble in water, so to isolate it the solution has to be evaporated to dryness. This drives off the volatile $\text{HCl}$, but the residual solid has to be treated to a little over 200°C to drive off all the water. In one experiment, 25.0g of $\text{AlCl}_3$ was mixed with 30.0g $\text{H}_2\text{SO}_4$. Eventually, 28.46g of pure $\text{Al}_2(\text{SO}_4)_3$ was isolated. Calculate the percent yield.
